

Predicted in Chapter 13 (mechanism)

**Individual estimates:
modestly affected,
largest at middling reliability**

Returned by the simulation (evidence)

H4: flexible arm 7% better on average
(upper bound -0.061 , margin 0.049) –
except seven bimodal low-reliability cells,
ratios 1.05 to 1.14

**The recovered distribution:
severely affected,
in the assumed shape's direction**

H1: KS ratio 0.80 at the design centre,
0.73 over the opportunity region;
control 1.016 on normal cells
(nothing to recover, nothing gained)

**Ranks: a separate,
conditional question**

rank losses nearly flat across all nine
combinations; the reliability tier,
not the method, carries the variance
